## **Remedial Design, Remedial Action, and Site Closure**

- Innovative remedial alternatives to address petroleum impacted soil and groundwater
- Feasibility studies
- Bench- and pilot-scale testing
- Remedial design and implementation
- Site closure

### **Description of Remedial Design, Remedial Action, and Site Closure:**

Storb Environmental has personnel with extensive experience in site remediation and can assist you in developing a remedial strategy suited to your site. Storb Environmental can provide complete, turnkey services to implement the selected remedial strategy from installation through site closure.

Storb Environmental personnel will analyze the conditions at your site and will develop a remedial strategy to address your specific needs. If necessary, a feasibility study can be prepared to evaluate several remedial in order to determine the most cost-effective alternative to address impacted media at your site. Storb Environmental personnel are experienced in all the latest remedial technologies such as soil vapor extraction, dual-phase extraction, bioremediation, and oxygen injection to name a few. Upon development of a remedial strategy, Storb Environmental will prepare and submit a Remedial Action Plan (RAP) to the appropriate regulatory agency. If required, bench-scale and pilot-scale tests can be performed to demonstrate the applicability of the technology to the specific site and conditions.

Upon approval of the RAP, Storb Environmental can provide complete remedial design services as well as permitting and installation of selected system. Detailed drawings and specifications can be prepared, suitable for competitive bidding. Alternatively, a conceptual design can be prepared and submitted to contractors in a design-build strategy. Storb Environmental will manage all facets of the installation to ensure that the system is constructed as designed.

Storb Environmental can provide operational support for remedial actions which involve technologies such as groundwater pump and treat or soil vapor extraction. We have personnel that are experienced in providing operation and maintenance (O&M) services for all types of systems. We can also handle all permitting issues and required submittals to the regulatory agencies.

Upon completion of the remedial action, Storb Environmental can decommission equipment and related appurtenances as part of closure activities. A closure report would be prepared which documents the completion of remedial actions and documents compliance with applicable cleanup standards.
